

ABSTRACT

A gaming terminal and method are provided with which allow casino managers or other game operators to customize paytables, including poker paytables. Preferably, the system can verify or assist in verifying that the paytables comply with one or more various standards such as regulatory standards, e.g., such that the paytables are legal. In one aspect, paytable verification calculations, such as calculations of overall payback or hold percentages, preferably in the manner acceptable to regulatory authorities, are performed in the electronic gaming terminal, e.g., using the gaming terminal microprocessor.
